Q what condition for $f_{xy} \neq f_{yx}$

Eulers theoram :

if $f(x,y)$ and its partial deriv..

f_x f_y f_{xy} f_{yx} are defined through open region contain point (a,b) and all continous at (a,b) then

$f_{xy}(a,b) = f_{yx}(a,b)$

$$\frac{\partial^3 f}{\partial x^2 \partial y} \Rightarrow \frac{\partial^2}{\partial x^2}\left(\frac{\partial f}{\partial y}\right)$$

Differentiability

when $x : x_0 \longrightarrow x_0 + \Delta x$

if x is differentiable

$y = f(x) \longrightarrow f'(x_0)\Delta x + \varepsilon \Delta x$

$\varepsilon \longrightarrow 0$

$\Delta x \longrightarrow 0$

$\Delta y = f(x_0 + \Delta x) - f(x_0)$

2 variable function

$z = f(x, y)$

$x : x_0 \longrightarrow x_0 + \Delta x$

$y : y_0 \longrightarrow y_0 + \Delta y$

$\Delta z = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0)$

if this condition holds then

$$\Delta z = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \varepsilon_1 \Delta x + \varepsilon_2 \Delta y$$

$\varepsilon_1, \varepsilon_1(\Delta x, \Delta y) \longrightarrow 0$

$\varepsilon_2(\Delta x, \Delta y) \longrightarrow 0$

function is differentiable at $x_0 y_0$

Total differential of z

$$\Delta z = dz + \varepsilon_1 \Delta x + \varepsilon_2 \Delta y$$

Necessary condition
existence of partial derivative at Point P.

Sufficient

f_x and f_y of $f(x,y)$ are continuous at every point in area (open region) R.

Q $Z = \tan^{-1}\left(\frac{y}{x}\right)$

find total differential ie $\underline{\underline{dz}}$ at $x_0 y_0$

$dZ = f_x(x_0\ y_0)\,\Delta x + f_y(x_0 y_0)\,\Delta y$

$f_x = \frac{\partial}{\partial x} f(x)$ since here it is Z we can say Z_x

$Z_x = \frac{1}{1+(y/x)^2}\frac{\partial}{\partial x}(y/x)$

$\frac{x^2}{x^2+y^2}\left(\frac{-y}{x^2}\right)$ Similarly $Z_y = \frac{x}{x^2+y^2}$

$= \frac{-y}{x^2+y^2}$.

$Z_y(a,b) = \frac{a}{a^2+b^2}$

$Z_x(a,b) = \frac{-b}{a^2+b^2}$

$dz = \left(\frac{-b}{a^2+b^2}\right)\Delta x + \left(\frac{a}{a^2+b^2}\right)\Delta y$

Q2. $U = (x^2+y^2+z^2)^{-3/2}$, $(x,y,z) \neq (0,0,0)$

find total differential of U at (a,b,c)

$U_x = \frac{-3}{2}(x^2+y^2+z^2)^{5/2}(2x)$

$= -3x(x^2+y^2+z^2)^{-5/2}$

$\Rightarrow -3b \big| (a^2+b^2+c^2)^{5/2}$

Simi ar for other variables

$$du = \frac{-3a\,\Delta x}{(a^2+b^2+c^2)^{5/2}} + \frac{3b\,\Delta y}{(a^2+b^2+c^2)^{5/2}} + \frac{-3c\,\Delta z}{(a^2+b^2+c^2)^{5/2}}$$

Proving differentiability at any point (a,b)

(1) Existence of partial derivative

(2) Eq 1 must hold (total differential)

Q $f(x,y) = x^2 + y^2$

$f_x = 2x \qquad f_x\big|_{a,b} = 2a$

$f_y = 2y \qquad f_y\big|_{a,b} = 2b$.

$$\Delta z = f_x(a,b)\Delta x + f_y(a,b)\Delta y + \varepsilon_1 \Delta x + \varepsilon_2 \Delta y \quad (1)$$

$= 2x\,\Delta x + 2y\,\Delta y$ on for point (a,b)

$2a\Delta x + 2b\Delta y + \varepsilon_1 \Delta x + \varepsilon_2 \Delta y \quad (2)$

$\Delta z = f(a+\Delta x, b+\Delta y) - f(a,b)$

$(a+\Delta x)^2 + (b+\Delta y)^2 - a^2 - b^2$

$\Delta x^2 + 2a\Delta x + \Delta y^2 + 2b\Delta y \quad (3)$

from (2) and (3)

$\Delta x^2 + 2a\Delta x + \Delta y^2 + 2b\Delta y$

$= 2a\Delta x + 2b\Delta y + \varepsilon_1 \Delta x + \varepsilon_1 \Delta y$

$\varepsilon_1 = \Delta x$
$\varepsilon_2 = \Delta y$ definitely

$\varepsilon_i \to 0$ if Δx or $\Delta y \to 0$

$\therefore$ Equation is differentiable.

Revisit
1. first order derivative
2. $\varepsilon \to 0 \ \forall \ \Delta x$ and Δy

Q $f(x,y) = \begin{cases} \dfrac{xy(x^2-y^2)}{x^2+y^2} & (x,y) \neq (0,0) \\ 0 & (x,y) = (0,0) \end{cases}$

$f_x\big|_{(0,0)}$; $\lim_{h \to 0} \dfrac{f(0+h, 0) - f(0,0)}{h}$

$\lim_{h \to 0} \left(\dfrac{0 - 0}{h}\right) = 0$

f_y $\lim_{h \to 0} \dfrac{(0, 0+h) - f(0,0)}{h}$

$\Rightarrow \dfrac{0 - 0}{0} = 0$

$\therefore f_x$ and f_y exist

$\Delta Z = f_x(x,y)\Delta x + f_y(0,0)\Delta y + \varepsilon_1 \Delta x + \varepsilon_2 \Delta y$

$= \varepsilon_1 \Delta x + \varepsilon_2 \Delta y$

$\Delta Z = f(0 + \Delta x, 0 + \Delta y) - f(0,0)$

$$\frac{\Delta x \Delta y (\Delta x^2 - \Delta y^2)}{\Delta x^2 + \Delta y^2} - f(0,0) \text{ ie } \underset{(\text{zero})}{0}$$

$f(0,0) = 0.$

this is equal to

$\epsilon_1 \Delta x + \epsilon_2 \Delta y$

$$e_1 = \frac{\Delta y \Delta x^2}{\Delta x^2 + y^2} \qquad \epsilon_2 = \frac{-\Delta x \Delta y^2}{\Delta x^2 + \Delta y^2}$$

ϵ_1 and ϵ_2 may not be unique.

As $\lim\limits_{\Delta x, \Delta y \to (0,0)}$ lim

Now we need to prove that limit exist ie when $\Delta x, \Delta y \to 0$, $\epsilon_1 \epsilon_2 \to 0$

Easist polar coordinate

$\Delta x = r\cos\theta \qquad \Delta y = r\sin\theta.$

$$\lim_{r \to 0} \frac{r^2\cos^2\theta \, r\sin\theta}{r^2} = 0$$

lim

Δ δ ϵ method

$|\cos^2\theta \sin\theta - 0| = |r\cos^2\theta \sin\theta|$

$\leq |r| = \delta$

$\delta = \epsilon$; then $|\cos^2\theta \, r\sin\theta| < \epsilon$ when $|r| < \delta$

Another method to prove differentiability.

$$\Delta Z = f_x(x_0 y_0)\Delta x + f_y(x_0 y_0)\Delta y + \varepsilon_1 \Delta x + \varepsilon_2 \Delta y$$

Let $\Delta \rho = \sqrt{\Delta x^2 + \Delta y^2}$

as $\Delta x, \Delta y \to 0$ $\Delta \rho \to 0$

as $\Delta \rho \to 0$

$\varepsilon_1, \varepsilon_2 \to 0$

$$dZ = \varepsilon_1 \Delta x + \varepsilon_2 \Delta y$$

$\therefore$ finite Quantity ; $\Delta \rho$

$\rho < N$

$$\Delta Z - dZ = \varepsilon_1 \Delta x + \varepsilon_2 \Delta y$$

$$\frac{\Delta Z - dZ}{\Delta \rho} = \frac{\varepsilon_1 \Delta x}{\Delta \rho} + \frac{\varepsilon_2 \Delta y}{\Delta \rho}$$

$\therefore$

$$\frac{\Delta Z - dZ}{\Delta \rho} = 0$$

Illustration

$$f(x,y) = \begin{cases} \dfrac{x^3 - y^3}{x^2 + y^2} & x.y \neq (0,0) \\ 0 & x.y = (0,0) \end{cases}$$

objective ① Proove 1st order partial derivative exist

② there is not differentiable. (Non differential)

① take $f(x,y)\big|_{(0,0)}$ $\lim_{h \to 0} \dfrac{f(0+h, 0) - f(0,0)}{h}$

$\lim_{h \to 0} \left(\dfrac{h^3 - 0}{h} - \dfrac{0}{h} \right)$

$\Rightarrow \dfrac{h^3}{h^3} = 1$

$\lim_{h \to 0} \dfrac{f(0, 0+h) - f(0,0)}{h}$

$\lim_{h \to 0} \dfrac{-h^3}{h^3} = -1 \therefore$ limit Exists.

② To proove differentiable we need.

$$\lim_{\Delta\rho \to 0} \frac{\Delta Z - dZ}{\Delta\rho} = 0$$

$$\Delta Z = f(0 + \Delta x, 0 + \Delta y) - f(x,y)$$

$$= \frac{\Delta x^3 - \Delta y^3}{\Delta x^2 + \Delta y^3} \quad \text{—— ①}$$

$$dZ = f_x(0,0)\,\Delta x + f_y(0,0)\,\Delta y$$

$\Delta x - \Delta y$

We just saw $f_x = 1$, $f_y = -1$

$$\lim_{\Delta\rho \to} \frac{\frac{\Delta x^3 - \Delta y^3}{\Delta x^2 + \Delta y^2} - \Delta x + \Delta y}{\Delta \rho}$$

we changed limit here b coz of cas rep in my

$$\lim_{\Delta x, \Delta y \to 0} \frac{\Delta x^3 - \Delta y^3 - \Delta x^3 + \Delta y \Delta x^2 - \Delta x \Delta y^2 + \Delta y^3}{(\Delta x^2 + \Delta y^2)^{3/2}}$$

$$\lim_{\Delta x, \Delta y \to 0} \frac{\Delta x^2 \Delta y - \Delta x \Delta y^2}{(\Delta x^2 + \Delta y^2)^{3/2}}$$; function will

if this lim Exist $\longrightarrow$ then differentiable at that point

So we try / check that it dont Exist.

Most easy $\to$ path dependent shoodar do

path $\Delta y = m\Delta x$

$$\lim_{\Delta x \to 0} \frac{\Delta x^2 m \Delta x - \Delta x\, m^2 \Delta x^2}{(\Delta x^2 + m^2 \Delta x^2)^{3/2}}$$

$$\lim_{\Delta x \to 0} \frac{\cancel{\Delta x^3}(m - m^2)}{\left[\cancel{\Delta x^2}(1 + m^2)\right]^{3/2}}$$

$$\lim_{\Delta x \to 0} \frac{m - m^2}{(1 + m^2)^{3/2}}$$

So lim depends on m

lim does Not Exist.

$\frac{\partial^2 \omega}{\partial y^2} = \frac{\partial}{\partial y}\left[f_u(-y) + x f_v\right]$

$= f_u(-1) + x\frac{\partial}{\partial y} f_v$

$-y\frac{\partial}{\partial y} f_u +$

chain Rule

$-y\left[\frac{\partial f_u}{\partial u}\frac{\partial u}{\partial y} + \frac{\partial f_u}{\partial v}\frac{\partial v}{\partial y}\right] - f_u$

$+ x\left[\frac{\partial f_v}{\partial u}\frac{\partial u}{\partial y} + \frac{\partial f_v}{\partial v}\frac{\partial v}{\partial y}\right]$

$\Rightarrow -y\left[f_{uu}(-y) + x f_{uv}\right] - f_u$

$+ x\left[-y(f_{uv}) + f_{vv} \cdot x\right]$

$\Rightarrow x^2 f_{vv} + y^2 f_{uu} - 2xy f_{uv} - f_u = \omega_{yy}$

$\omega_{xx} + \omega_{yy} = x^2 + y^2 (f_{uu} + f_{vv})$

$= 0.$

VIMP to tell which variables are dependent; which are independent.

Example : $\omega = x^2 + y^2 + z^2$, $z = x^2 + y^2$

find $\frac{\partial \omega}{\partial x}$?

Basic Assumption

ω = dependent ; x = independent.

Others, z, y = dont know !!

Dependent	independent
ω, z	x, y — 1
ω, y	x, z — 2

for case 1

$$\frac{\partial \omega}{\partial x} = 2x + 0 + 2z\, z_x$$
$$= 2x + 2z\,(2x)$$
$$2x + 4xz$$
$$2x + 4x\,(x^2 + y^2)$$
$$= 4x^3 + 4xy^2 + 2x$$

for case 2

$$\frac{\partial \omega}{\partial x} = 2x + 2y\, y_x + 0$$

$$\boxed{\begin{array}{l} y^2 = z - x^2 \\ 2y \cdot y_x = -2x \end{array}}$$

$$\frac{\partial \omega}{\partial x} = 2x + -2x$$
$$= 0$$
